

Project Design Phase
Problem – Solution Fit

Date	29 September 2026
Team ID	SWTID-2026-9956
Project Name	Auto Ticket Classification Using Flow Designer
Maximum Marks	2 Marks

Problem – Solution Fit:

School IT Helpdesk staff receive multiple IT support requests from users. Tickets often require manual review to identify the appropriate Category and Subcategory based on the issue description. This manual classification can increase processing time and may result in inconsistent categorization.

Common issues include:

- Wi-Fi or Network problems
- Projector-related problems
- Forgot Password requests
- Slow Computer or Performance problems

The existing process requires the helpdesk staff to interpret the user's issue and manually assign the appropriate Category and Subcategory. This creates an opportunity to automate repetitive classification tasks.

Customer / Target User

Customer	Problem / Need
IT Helpdesk Staff	Need to process and classify IT tickets quickly without manually reviewing every ticket.
School Staff / Students	Need their reported IT issues to be correctly categorized and acknowledged quickly.
IT Administrators	Need standardized and consistently categorized ticket information for effective ticket management.

Problem–Solution Fit:

PS No.	I am (Customer)	I'm trying to	But	Because	Which makes me feel
PS-1	IT Helpdesk Staff	Process incident requests quickly	I have to manually review and classify tickets	Ticket descriptions need to be interpreted before assigning Category and Subcategory	The process is repetitive and time-consuming

PS-2	IT Helpdesk Staff	Assign the correct Category and Subcategory	I have to manually identify the appropriate classification	Different users describe similar IT issues differently	Concerned about inconsistent classification
PS-3	School Staff / Students	Submit an IT support request	I may not immediately receive confirmation	Ticket confirmation is not automated	Uncertain about the request status
PS-4	IT Administrator	Maintain standardized ticket information	Manual classification can result in inconsistent data	Ticket values depend on manual selection	Concerned about data consistency
PS-5	IT Helpdesk Staff	Handle common IT issues efficiently	I repeatedly perform the same classification task	Common issues follow predictable patterns	The work becomes repetitive

Existing Situation:

Aspect	Current Situation
Ticket Creation	User creates an IT support ticket with issue details.
Issue Review	IT Helpdesk staff manually review the Short Description.
Classification	Helpdesk staff manually select Category and Subcategory.
Ticket Processing	Classified ticket is processed by the IT Helpdesk.
Notification	User may require confirmation after submitting the request.

Proposed Solution:

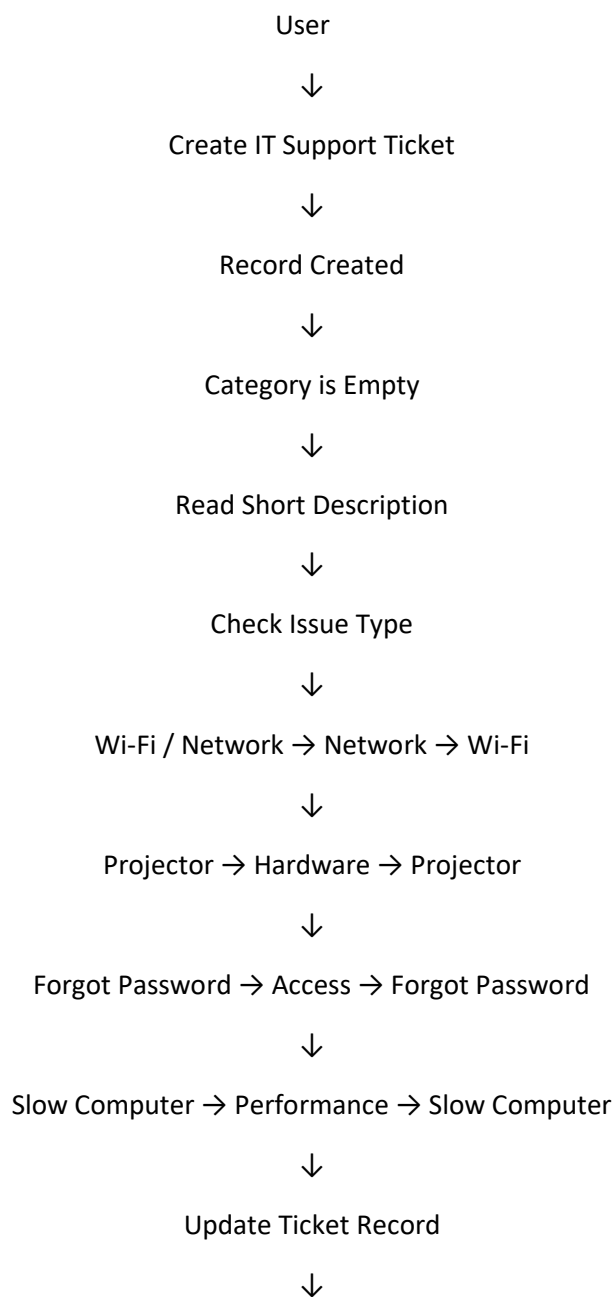

Requirement	Proposed Solution
Automatic ticket classification	Use ServiceNow Flow Designer to classify tickets based on Short Description.
Automatic Category assignment	Flow identifies the appropriate Category based on issue keywords.
Automatic Subcategory assignment	Flow assigns the corresponding Subcategory.
Dependent classification	Category and Subcategory are maintained using predefined mappings.

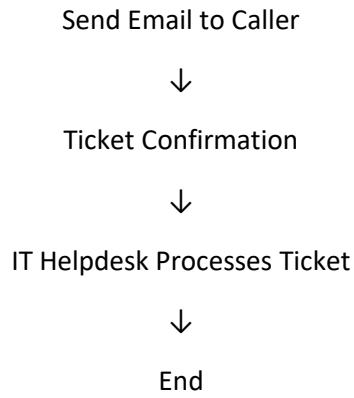

Automated notification	Send an email automatically to the Caller after classification.
Standardized information	Store ticket information using predefined fields and values.

Category and Subcategory Mapping:

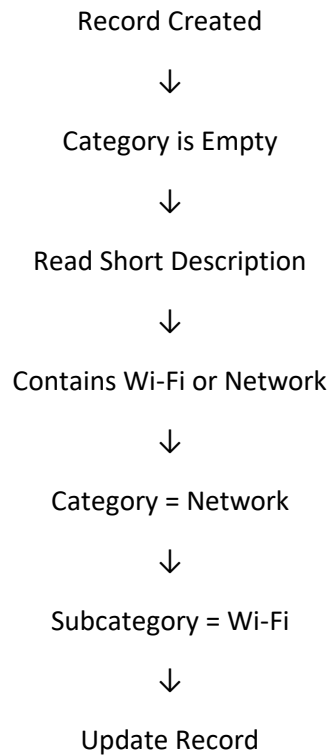

Issue	Category	Subcategory
Wi-Fi / Network	Network	Wi-Fi
Projector	Hardware	Projector
Forgot Password	Access	Forgot Password
Slow Computer	Performance	Slow Computer

Proposed Solution Flow:

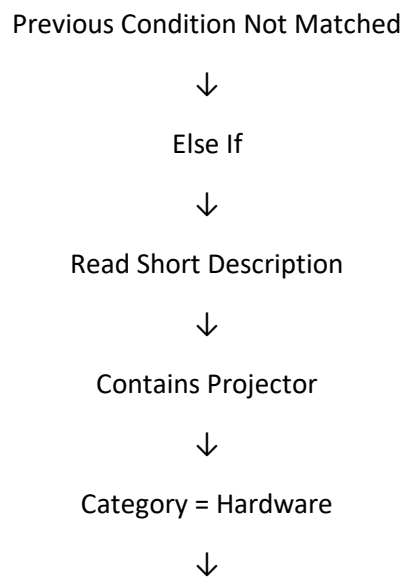

Wi-Fi / Network Classification Flow

Projector Classification Flow:

Subcategory = Projector

Update Record

Forgot Password Classification Flow:

Previous Conditions Not Matched

Else If

Read Short Description

Contains Forgot Password

Category = Access

Subcategory = Forgot Password

Update Record

Slow Computer Classification Flow:

Previous Conditions Not Matched

Else If

Read Short Description

Contains Slow Computer

Category = Performance

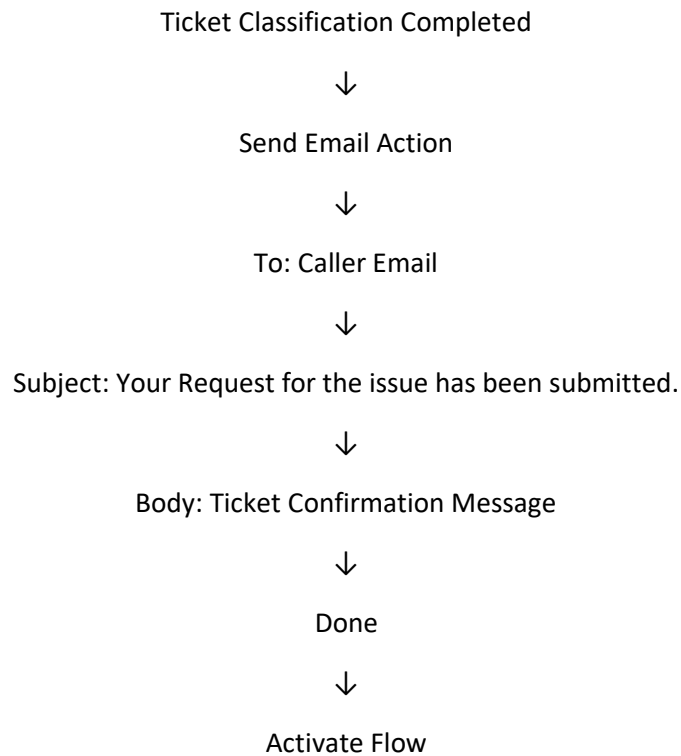

Subcategory = Slow Computer

Update Record

Email Notification Flow

Complete End-to-End Process:

Step	Process
1	User creates an IT support ticket
2	Record is created
3	System checks whether Category is empty
4	System reads Short Description
5	System checks the issue type
6	System identifies the appropriate Category
7	System identifies the appropriate Subcategory
8	Ticket record is automatically updated
9	Email notification is sent to the Caller
10	IT Helpdesk processes the classified ticket

Problem–Solution Fit:

Problem	Solution	Fit
Manual ticket classification	Automated Flow Designer classification	Automates repetitive classification
Incorrect or inconsistent categorization	Predefined Category and Subcategory mapping	Standardizes ticket classification
Repeated review of common issues	Keyword-based conditional logic	Handles defined common issue types automatically
Lack of immediate confirmation	Automated email notification	Provides confirmation to Caller
Increasing ticket-processing workload	Automated ticket processing	Reduces repetitive manual activities
